

TasteMate AI — Submission Summary

One-page submission: report, live UI screenshot and architecture diagram.

Project Summary

TasteMate AI is a five-agent pipeline (Maya → Lina → Alex → Sam → Daniel) producing personalised restaurant/dish recommendations. Frontend is a Vite+React demo with an MCP-backed chat assistant 'Nora' that triggers the pipeline.

How it works

The frontend POSTs sequentially to backend agent endpoints; each agent processes the previous handoff and returns structured briefs. Final outputs are validated by Daniel and presented to customers.

Run & verification

Start backend (Node) on port 3001 and frontend dev (Vite). Ask Nora: "Recommend dishes for dinner" to run the full pipeline. Accessibility scan using axe-core reported no violations for the tested page.

Notes: Backend endpoints — `/api/agents/*/run` and `/api/chatbot/run`.
